[2027학년도 9월 모평]

Leaders come in all shapes and sizes, but successful leaders tend to have one thing in common: the ability to share someone else's feelings, known as empathy. While empathy forms in everyone to some degree, effective leaders know how to develop this emotional guidance system ① to connect with others' feelings and perspectives. However, empathy in leaders is more than ② simply being kind to employees, clients, and customers. Empathetic people seem more approachable, focusing on the words of others. Listening to the needs of employees ③ enable leaders to clearly identify what makes them feel heard. Utilized in this way, empathy can be considered a crucial part of ④ maintaining employee satisfaction. Leaders who are unable to surround themselves with competent employees will not be successful. Indeed, a leader's failure to empathize with talented workers is one of the main situations ⑤ that could lead them to leave an organization. In this case, the organization must spend precious time and money to find suitable replacements for them.

[2027학년도 6월 모평]

Fashion is always deeply cultural, and an excellent example of this can be seen in the evolution of European clothing. At the beginning of the Middle Ages, clothing tended to be simple and was ① frequently made of rough wool or animal furs. With advances in cloth making, however, fashion began moving toward styles ② what were more elaborate and form-fitting. In the Renaissance and Elizabethan eras, styles became even more refined. The clothes that wealthy people were wearing became increasingly fancier, with a particular emphasis being placed on smaller waists. The connection between clothing and social status was so pronounced that laws were enacted ③ to limit the wearing of certain luxury items. ④ Allowed only for higher social classes, luxurious styles and decorations such as feathers, silk, or velvet were used as a means of demonstrating one's standing in society. This was further reinforced as upperclass styles came to be explicitly incorporated into cultural ceremonies so that ⑤ their wearers' roles could be identified clearly.

[2026년 5월 학평]

A study by Eurofound found that young people who were working remotely ① reported more difficulties in managing their workload than older colleagues. Moreover, many young people began their careers working remotely during the pandemic, unlike those in older generations who had many years to establish interpersonal connections and embed ② themselves in the organizational culture in an in-person job. A survey by Prospects found that almost half of students and graduates in the United Kingdom found ③ it difficult to work from home during the pandemic due to a lack of suitable workspace or distractions. While young people may struggle long-term with remote work, perhaps more of a hybrid model ④ where they can work from home part of the time and work onsite other times, would work well for them. But it may not be that they need a formal hybrid structure with specific days of the week designated for working remotely but instead a fluid option that allows them, if possible, depending on the job role, ⑤ chooses their day-to-day work location.

Darwin understood that since inheritance is conservative, it is in the nature of the organism to impose itself on the surroundings, ① producing many highly similar but variable offspring regardless of the nature of the conditions. He further recognized that these fundamental aspects of the nature of the organism ② imply reproductive overrun, with organisms routinely producing more offspring than there are resources to support them. The need to survive implies that the capacity for using necessary resources must complement the opportunity to use ③ them. But needs and opportunity do not perfectly match. Inheritance produces the capacities for exploiting the surroundings, but in a way that is indifferent to the surroundings. Offspring cannot anticipate the nature of the conditions ④ which they find themselves, much less alter themselves in ways that are suitable to any changes in those conditions. While it is true that organisms can express some amount of flexibility in their form and function in response to their immediate surroundings, these adjustments are ⑤ minor compared to the constraints of inheritance. As a result, not every living thing can live everywhere.

\*offspring: 자손

[2026학년도 수능]

We are exceptionally smart, and this helps us adapt to a wide range of environments. But we are not nearly smart enough as individuals ① to solve the adaptive problems that confronted modern humans as they spread across the globe. The package of tools, foraging techniques, ecological knowledge, and social arrangements used by any group of foragers ② being far too complex for any individual to create. We are able to learn all the things we need to know in each of the many different environments ③ in which we live only because we acquire information from others. We are much better at learning from others than other species are, and we are ④ motivated to learn from others even when we do not understand why our models are doing what they are doing. This psychology allows human populations to accumulate pools of adaptive information that ⑤ greatly exceed the inventive capacities of individuals.

\*forage: 구하러 다니다

[2025년 10월 학평]

The physical act of movement in the morning is not just beneficial for the body — it serves as a powerful stimulant for the brain, ① awakening it from the stillness of sleep and preparing it for the demands of the day. This awakening goes beyond physical health; it plays a critical role in enhancing cognitive function, particularly in the realms of creativity and imagination. One of the key mechanisms ② which this occurs is increased blood flow to the hippocampus, a part of the brain responsible for memory, learning, and the creation of new ideas. The hippocampus, often described as the brain's center for imagination and memory consolidation, thrives on the increased oxygenation and nutrients ③ provided by physical movement. Studies published in journals highlight the positive effects of regular morning exercise on cognitive flexibility and creative thinking, confirming that exercise not only promotes physical health but also stimulates neural plasticity — the brain's ability to reorganize ④ itself by forming new neural connections. This adaptability is essential for creative thought, as it allows individuals ⑤ to approach problems from new angles, make novel associations, and think more differently.

[2026학년도 9월 모평]

Honey can be eaten by itself or mixed with other ingredients. Natural or pure honey has had no additives, preservatives or synthetic ingredients added. Also ① referred to as ‘undiluted’, it is usually more expensive than diluted honeys. Natural honey can also be called ‘blended honey’, ② which honeys from various sources are blended together — not by the bees, but by human processors and distributors in stages after the honey has been collected. Blending is frequently done for taste as well as marketing reasons, especially since some consumers find the darker honeys too ③ strong. Mixing different types of honey together can make it more palatable, and also gives a more uniform flavour — this is an important consideration for producers and retailers, who ④ feel the need to guarantee reliable, unsurprising (typically mild) flavours to their customers. Clover is one of the most popular honeys in the U.S., and ⑤ its mild flavour and taste have become familiar to many Americans.

\*dilute: 묽게 하다

\*\*palatable: 입에 맞는

[2025년 7월 학평]

There is a kind of artificial intelligence application that is frequently advertised, which can be described as “vaporware”. Vaporware is applications that have either been announced or made ① available for sale but are not yet fully functional as artificial intelligence applications. It is often systems that seem to run on artificial intelligence technologies, but which in fact ② do not. Instead, they are frequently built by people manually adding the content ③ that the artificial intelligence application is supposed to be processing. This is frequently done because initially it is cheaper to pay people to add this content than it is ④ to develop full artificial intelligence capabilities and populate the data. Vaporware can be used for many reasons. Sometimes a product may start to be sold before it is fully developed. Taking a vaporware product to market means developers can validate ideas with customers before investing the amounts ⑤ require to build a full application, allowing for more flexibility in development and for more time to build data.

\*populate: 채우다

## 9. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2026학년도 6월 모평]

Changes in the degree of closeness ① are quite important in managing emotional intensity. Take, for example, emotions induced by television. Closeness and familiarity are important in making the fictional environment more ② real. Accordingly, most TV shows are set in the present or in a time within the memory of the viewers. Most characters are supposed to be types with whom we are familiar. Such closeness and familiarity make it easier for us ③ perceive the imaginary story to be a real one. In other circumstances, such as when violence is shown on TV, the closeness variable is used to reduce emotional intensity. Television entertainment tends to place social problems involving violence in another time and place, letting us watch those fictionalized characters search for solutions to our problems in settings ④ safely distanced from our own. When violence occurs in a contemporary setting, it is generally the product of the interaction of police and criminals — again, it is ⑤ removed from the lives of good citizenry.

[2025년 5월 학평]

Working with neuroscientists who use neuroimaging to understand how the human brain works, anthropologist Simon Cohn has shown the extent ① to which scientists need to develop personal, even intimate, relationships with their subjects in order to secure their cooperation. Only by enlisting subjects in a social relationship, even if briefly, ② do the researchers feel they can depend on the subjects to follow directions to the best of their ability. ③ Strapped down uncomfortably in a dark, noisy scanner, subjects must nonetheless pay attention and follow directions in order to produce data the researchers can use. Before the subjects ever enter the scanner, researchers provide ④ them with reassurance and sympathy and share personal experiences, creating a subjective alliance between researcher and subject. Although these tactics might influence the specific subjective experiences revealed in the scanner, they are carefully eliminated from the experimental reports so that only the signals from subjects' brains in response to stimuli in the scanner ⑤ coming to light.

[2025년 3월 학평]

We lack a sufficient vocabulary for ① making sense of the sources of error. The more scientific knowledge we accumulate, the better we understand that the ignorance ② over which the knowledge enterprise is built is shockingly deep. For instance, it turned out that psychoanalysis's attempt to delimit the sources of error by categorizing the kinds of mistakes to which humans are subject in light of the therapeutic situation in the talking cure ③ draw on misguided assumptions about the normalcy conditions for subjects. Digging deeper into the structure of the human mind as well as into the specific embodiment of human knowers equipped with a complex nervous system ④ showed that our mental life is filled with illusions on all levels of knowledge acquisition, from sensation to perception, from scientific discourse to the use of technology based on the latest scientific discovery. Yet, once again, we cannot make sense of this picture of ourselves as immersed in the area of ignorance and illusion without at the same time relying on a huge background of shared, objective knowledge that makes our ignorance ⑤ available to us. Subjectivity and objectivity are interwoven with our fallibility.

\*embodiment: 화신(化身)

\*\*be immersed in: ~에 깊이 빠지다

\*\*\*fallibility: 불완전성, 틀릴 가능성

## 12. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2025학년도 수능]

Think of yourself. When you decide to get up and get a drink of water, for example, you don't consciously organize or consider the host of steps involved. Imagine if we ① had to consider every single muscle that needed to be contracted or relaxed just to stand up and walk. It would be tiresome and very slow — as patients recovering from a brain injury affecting the motor system ② knows. The autopilot parts of our brain do it for us automatically, ③ freeing up our conscious mind for more important jobs. It is the older parts of our brain ④ that support these automatic processes that allow us to move, hear, see, and use many of our social skills. More recently evolved abilities like talking, reading, and writing are far less automated. So, most of the time, ⑤ what you are perceiving, feeling, or thinking is based on a very crude and fast analysis that happens completely without your awareness.

\*crude: 투박한

[2024년 10월 학평]

Sometime late in the next millennium, our descendants may head off to other star systems. They may use comets as stepping-stones, some of which are only ① loosely bound to our sun because they reach almost halfway to the nearest star system, Alpha Centauri. Our remote descendants may eventually colonize much of our galaxy just as the first living organisms on Earth once colonized Earth's young oceans. Interstellar migrations will depend on as yet unimagined technologies for driving ships, for maintaining sustainable environments, and for putting humans into hibernations ② last for centuries. Interstellar journeys will also depend on the existence of groups willing ③ to risk long and dangerous voyages with little or no hope of returning. It would take spaceships ④ traveling at 1 percent of the speed of light more than four hundred years to reach the Alpha Centauri system. But if they spread out from there at a similar rate, they could settle star systems throughout the Milky Way within one hundred million years, ⑤ which is just a bit longer than the span of time since dinosaurs ruled our Earth.

\*comet: 혜성  
\*\*hibernation: 동면

14. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?  
[2025학년도 9월 모평]

Victorian England is characterised by the full development of the Industrial Revolution. England became the first industrial nation in the world and, by 1850, the first nation to have more people ① employed in industry than in agriculture. Expanding trade coincided with the growth of the Empire and brought great wealth to Britain, but this wealth was not ② evenly distributed. Many enterprising individuals (the 'self-made men') rose from humble origins to positions of wealth and influence, but large sections of the working class ③ were forced into the overcrowded slums of large cities where they worked long hours for low wages in unhealthy conditions. The manufacturing towns of the north of England provided some of the worst examples and ④ inspired such socially conscious novels as Kingsley's *Alton Locke*, Gaskell's *Mary Barton*, and Dickens's *Hard Times*. In the south there was London, already the largest city in the world, showing all the crime, evil, and misery ⑤ whose result from overpopulation and unplanned growth.

15. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?  
[2024년 7월 학평]

When we assess potential, we make the cardinal error of focusing on starting points—the abilities that are immediately visible. In a world obsessed with innate talent, we assume the people with the most promise ① are the ones who stand out right away. But high achievers vary dramatically in their initial aptitudes. If we judge people only by what they can do on day one, their potential remains hidden. You can't tell ② where people will land from where they begin. With the right opportunity and motivation ③ to learn, anyone can build the skills to achieve greater things. Potential is not a matter of where you start, but of how far you travel. We need to focus less on starting points and more on distance ④ traveled. For every Mozart who makes a big splash early, there are multiple Bachs who ascend slowly and ⑤ blooming late. They're not born with invisible superpowers; most of their gifts are homegrown or homemade.

\*cardinal: 아주 중요한

[2025학년도 6월 모평]

What makes practicing retrieval so much better than review? One answer comes from the psychologist R. A. Bjork's concept of desirable difficulty. More difficult retrieval ① leads to better learning, provided the act of retrieval is itself successful. Free recall tests, in which students need to recall as much as they can remember without prompting, tend to result in better retention than cued recall tests, in which students ② give hints about what they need to remember. Cued recall tests, in turn, are better than recognition tests, such as multiple-choice answers, ③ where the correct answer needs to be recognized but not generated. Giving someone a test immediately after they learn something improves retention less than giving them a slight delay, long enough so that answers aren't in mind when they need ④ them. Difficulty, far from being a barrier to ⑤ making retrieval work, may be part of the reason it does so.

\*retrieval: 불러오기  
\*\*retention: 보유력

## 17. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2024년 5월 학평]

When a new pathogen emerges, one way it transitions from wherever it has been living into a new host may be the acquisition of new traits. Imagine that in ① its hourly struggle to survive over long periods of time and many generations, a fungus species might acquire a protective capsule—a bit of coating—that shields it or even masks it from other microbes or cells. Then it acquires some enzymes that enable it to survive ② whatever chemicals other microbes might throw at it. If it can overcome these chemicals, it may also overcome the same or similar chemicals ③ used as antifungal drugs. Maybe it also evolves to tolerate warmer temperatures. Now we've got a yeast that once made its home in an apple tree or in a wetland but ④ that at this point can live quite happily in our body, hide from our immune system, and disarm our drugs. Then some of us carry it from one country to another and then another, and eventually it finds a host in a hospital patient who has recently received an organ transplant or ⑤ are elderly with a weakened immune system.

\*\*\*yeast: 효모

## 18. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2024년 3월 학평]

The process of crossing cultures challenges the very basis of who we are as cultural beings. It offers opportunities for new learning and growth. Being “uprooted” from our home ① brings us understanding not only of the people and their culture in our new environment, but of ourselves and our home culture. Although the difficulties that can arise from crossing cultures are often shocking, success stories are everywhere. Despite, or rather because of, the suffering and ambivalence we undergo when we cross cultures, we gradually find ourselves ② uniquely privileged to define ourselves and others anew with clarity and insight that we could not have cultivated without leaving home. ③ Adapting to a new and unfamiliar culture, then, is more than survival. It is a life-changing journey. It is a process of “becoming”—personal reinvention, transformation, growth, reaching out beyond the boundaries of our own existence. The process does not require that we abandon our former personalities and the cultures ④ which we were born. Rather, it compels us to find ⑤ ourselves as if for the first time, particularly those “cultural invariants” within us—aspects that we hold dear and refuse to compromise.

\*ambivalence: 상반되는 감정, 모순

[2024학년도 수능]

A number of studies provide substantial evidence of an innate human disposition to respond differentially to social stimuli. From birth, infants will orient preferentially towards the human face and voice, ① seeming to know that such stimuli are particularly meaningful for them. Moreover, they register this connection actively, imitating a variety of facial gestures that are presented to them — tongue protrusions, lip tightenings, mouth openings. They will even try to match gestures ② which they have some difficulty, experimenting with their own faces until they succeed. When they ③ do succeed, they show pleasure by a brightening of their eyes; when they fail, they show distress. In other words, they not only have an innate capacity for matching their own kinaesthetically experienced bodily movements with ④ those of others that are visually perceived; they have an innate drive to do so. That is, they seem to have an innate drive to imitate others whom they judge ⑤ to be ‘like me’.

\*innate: 타고난

[2023년 10월 학평]

Dr. Joseph Bell was a professor of medicine at the University of Edinburgh. His students were amazed by his astonishing powers of observation. He seemed able to determine what patients did for a living, or what illness ① they might have, simply by glancing in their direction. One time he concluded that a patient ② had walked across a golf course on the way to the doctor, simply by looking at his shoes. One of Bell's students was particularly impressed with his teacher's abilities. He filled up notebooks with examples of ③ what he called Bell's “eerie trick of spotting details.” The student eventually went into practice himself outside London. When business was slow he filled his spare moments by writing stories. He took Dr. Bell's powers of perception, and gave them to a character of his own making—a character who made the young doctor, Arthur Conan Doyle, ④ famous around the world. And so the professor who made even the most complex diagnosis seem “elementary” ⑤ becoming the inspiration for fiction's greatest detective, Sherlock Holmes.

\*eerie: 으스스한  
\*\*diagnosis: 진단

## 21. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2024학년도 9월 모평]

Viewing the stress response as a resource can transform the physiology of fear into the biology of courage. It can turn a threat into a challenge and can help you ① do your best under pressure. Even when the stress doesn't feel helpful—as in the case of anxiety—welcoming it can transform ② it into something that is helpful: more energy, more confidence, and a greater willingness to take action. You can apply this strategy in your own life anytime you notice signs of stress. When you feel your heart beating or your breath quickening, ③ realizing that it is your body's way of trying to give you more energy. If you notice tension in your body, remind yourself ④ that the stress response gives you access to your strength. Sweaty palms? Remember what it felt like ⑤ to go on your first date—palms sweat when you're close to something you want.

## 22. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2023년 7월 학평]

The intelligence of monkeys pales in comparison with that of our closest relatives, the great apes: orangutans, gorillas, chimpanzees, and bonobos, whose brains are twice as ① large relative to their body weight. Most primatologists believe the apes acquired their larger brains to help them communicate with and ② manipulate their peers. And they certainly do exhibit complex social interactions within their group; they seem capable of feeling empathy, have a self-image, and exhibit a degree of consciousness as they can recognize ③ themselves in a mirror. But this “social hypothesis” does not explain why it was the great apes that became so clever, rather than monkeys or a group of terrestrial mammals. Nor does it explain why orangutans, who seldom encounter their neighbors, ④ being so intelligent. It seems likely that some other factor must have been in play ⑤ that caused apes to become more intelligent in the first place, and which could subsequently have enabled some members of the group to develop high-level sociality.

\*primatologist: 영장류 동물학자

\*\*terrestrial: 육상의

## 23. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2024학년도 6월 모평]

Consider The Wizard of Oz as a psychological study of motivation. Dorothy and her three friends work hard to get to the Emerald City, overcoming barriers, persisting against all adversaries. They do so because they expect the Wizard to give ① them what they are missing. Instead, the wonderful (and wise) Wizard makes them aware that they, not he, always had the power ② to fulfill their wishes. For Dorothy, home is not a place but a feeling of security, of comfort with people she loves; it is wherever her heart is. The courage the Lion wants, the intelligence the Scarecrow longs for, and the emotions the Tin Man dreams of ③ being attributes they already possess. They need to think about these attributes not as internal conditions but as positive ways ④ in which they are already relating to others. After all, didn't they demonstrate those qualities on the journey to Oz, a journey ⑤ motivated by little more than an expectation, an idea about the future likelihood of getting something they wanted?

## 24. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은? [3점]

[2023년 4월 학평]

Providing feedback to students is a critical task of teachers. General psychology has shown that knowledge of results is necessary for improving a skill. Advanced musicians are able to self-critique their performances, but developing music students ① rely on teachers to supply evaluative feedback. The most constructive feedback is that ② which expresses the discrepancies between a student's performance of a piece of music and an optimal version. Expert teachers give more detailed feedback than general appraisals, and music educators generally recognize that more specific teacher feedback facilitates student performance improvement. Researchers also have explored ③ whether the feedback of effective teachers is more often positively or negatively expressed, that is, constituting praise or criticism. One might intuitively think that positive comments are more ④ motivated to students and, as a result, are more associated with effective teaching. The research, however, paints a slightly different picture. Although positive feedback is ⑤ likely more helpful with younger learners and in one-on-one instruction, more advanced music students seem to accept and benefit from greater levels of criticism in lessons.

[2023년 3월 학평]

From the 8th to the 12th century CE, while Europe suffered the perhaps overdramatically named Dark Ages, science on planet Earth could be found almost ① exclusively in the Islamic world. This science was not exactly like our science today, but it was surely antecedent to ② it and was nonetheless an activity aimed at knowing about the world. Muslim rulers granted scientific institutions tremendous resources, such as libraries, observatories, and hospitals. Great schools in all the cities ③ covering the Arabic Near East and Northern Africa (and even into Spain) trained generations of scholars. Almost every word in the modern scientific lexicon that begins with the prefix “al” ④ owes its origins to Islamic science—algorithm, alchemy, alcohol, alkali, algebra. And then, just over 400 years after it started, it ground to an apparent halt, and it would be a few hundred years, give or take, before ⑤ that we would today unmistakably recognize as science appeared in Europe—with Galileo, Kepler, and, a bit later, Newton.

Trends constantly suggest new opportunities for individuals to restage themselves, representing occasions for change. To understand how trends can ultimately give individuals power and freedom, one must first discuss fashion’s importance as a basis for change. The most common explanation offered by my informants as to why fashion is so appealing is ① that it constitutes a kind of theatrical costumery. Clothes are part of how people present ② them to the world, and fashion locates them in the present, relative to what is happening in society and to fashion’s own history. As a form of expression, fashion contains a host of ambiguities, enabling individuals to recreate the meanings ③ associated with specific pieces of clothing. Fashion is among the simplest and cheapest methods of self-expression: clothes can be ④ inexpensively purchased while making it easy to convey notions of wealth, intellectual stature, relaxation or environmental consciousness, even if none of these is true. Fashion can also strengthen agency in various ways, ⑤ opening up space for action.

\*stature: 능력

## 27. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은? [3점]

[2022년 10월 학평]

The idea that leaders inherently possess certain physical, intellectual, or personality traits that distinguish them from nonleaders ① was the foundational belief of the trait-based approach to leadership. This approach dominated leadership research from the late 1800s until the mid-1940s and has experienced a resurgence of interest in the last couple of decades. Early trait theorists believed that some individuals are born with the traits that allow ② them to become great leaders. Thus, early research in this area often presented the widely stated argument ③ that “leaders are born, not made.” Also, some of the earliest leadership studies were grounded in what ④ referred to as the “great man” theory because researchers at the time focused on identifying traits of highly visible leaders in history who were typically male and associated with the aristocracy or political or military leadership. In more recent history, numerous authors have acknowledged that there are many enduring qualities, ⑤ whether innate or learned, that contribute to leadership potential. These traits include such things as drive, self-confidence, cognitive ability, conscientiousness, determination, intelligence, and integrity.

## 28. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2023학년도 9월 모평]

Recognizing ethical issues is the most important step in understanding business ethics. An ethical issue is an identifiable problem, situation, or opportunity that requires a person to choose from among several actions that may ① be evaluated as right or wrong, ethical or unethical. ② Learn how to choose from alternatives and make a decision requires not only good personal values, but also knowledge competence in the business area of concern. Employees also need to know when to rely on their organizations’ policies and codes of ethics or ③ have discussions with co-workers or managers on appropriate conduct. Ethical decision making is not always easy because there are always gray areas ④ that create dilemmas, no matter how decisions are made. For instance, should an employee report on a co-worker engaging in time theft? Should a salesperson leave out facts about a product’s poor safety record in his presentation to a customer? Such questions require the decision maker to evaluate the ethics of his or her choice and decide ⑤ whether to ask for guidance.

## 29. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은? [3점]

[2022년 7월 학평]

The spider chart, also called a radar chart, is a form of line graph. It helps the researcher to represent their data in a chart ① that shows the relative size of a response on one scale for interrelated variables. Like the bar chart, the data needs to have one scale which is common to all variables. The spider chart is drawn with the variables spanning the chart, ② creating a spider web. An example of this is seen in a research study looking at self-reported confidence in year 7 students across a range of subjects ③ have taught in their first term in secondary school. The researcher takes the responses from a sample group and ④ calculates the mean to plot on the spider chart. The spider chart allows the researcher to easily compare and contrast the confidence level in different subjects for the sample group. The chart, like the pie chart, can then be broken down for different groups of students within the study ⑤ to elicit further analysis of findings.

## 30. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은? [3점]

[2023학년도 6월 모평]

Ecosystems differ in composition and extent. They can be defined as ranging from the communities and interactions of organisms in your mouth or ① those in the canopy of a rain forest to all those in Earth's oceans. The processes ② governing them differ in complexity and speed. There are systems that turn over in minutes, and there are others ③ which rhythmic time extends to hundreds of years. Some ecosystems are extensive ('biomes', such as the African savanna); some cover regions (river basins); many involve clusters of villages (micro-watersheds); others are confined to the level of a single village (the village pond). In each example there is an element of indivisibility. Divide an ecosystem into parts by creating barriers, and the sum of the productivity of the parts will typically be found to be lower than the productivity of the whole, other things ④ being equal. The mobility of biological populations is a reason. Safe passages, for example, enable migratory species ⑤ to survive.

[2022년 4월 학평]

The actual problems with monopolies are caused by statism, not capitalism. Under a statist social system, taxes, subsidies, tariffs, and regulations often serve to protect existing large players in the marketplace. Those players often use crony tactics to retain or expand the protections: a new tariff preventing foreign competition, a subsidy making it harder for new players ① to compete with them, or a regulatory measure that a large company has the resources to comply with. Under a capitalist social system, on the other hand, the government has no say in how ② dominantly a company may become in its industry or how companies take over and merge with one another. Furthermore, a capitalist society doesn't have rights-violating taxes, tariffs, subsidies, or regulations ③ favoring anybody nor does it have antitrust laws. Under capitalism, dominance can only be achieved by becoming really good at ④ what you're doing. And to maintain dominance, you have to continue to stay ahead of the competition, which sees your dominance and profits as a sign ⑤ that there is money to be made by others as well.

\*statism: 국가 통제주의

\*\*crony: 정실(사사로운 정에 이끌리는 일)

\*\*\*antitrust law: 독점 금지법

We don't know what ancient Greek music sounded like, because there are no examples of it in written or notated form, nor ① has it survived in oral tradition. Much of it was probably improvised anyway, within certain rules and conventions. So we are forced largely to guess at its basis from the accounts of writers such as Plato and Aristotle, who were generally more concerned with writing about music as a philosophical and ethical exercise ② as with providing a technical primer on its practice. It seems Greek music was predominantly a vocal form, ③ consisting of sung verse accompanied by instruments such as the lyre or the plucked kithara (the root of 'guitar'). In fact, Plato considered music in which the lyre and flute played alone and not as the accompaniment of dance or song ④ to be 'exceedingly coarse and tasteless'. The melodies seem to have had a very limited pitch range, since the instruments ⑤ generally span only an octave, from one E (as we'd now define it) to the next.

Like whole individuals, cells have a life span. During their life cycle (cell cycle), cell size, shape, and metabolic activities can change dramatically. A cell is “born” as a twin when its mother cell divides, ① producing two daughter cells. Each daughter cell is smaller than the mother cell, and except for unusual cases, each grows until it becomes as large as the mother cell ② was. During this time, the cell absorbs water, sugars, amino acids, and other nutrients and assembles them into new, living protoplasm. After the cell has grown to the proper size, its metabolism shifts as it either prepares to divide or matures and ③ differentiates into a specialized cell. Both growth and development require a complex and dynamic set of interactions involving all cell parts. ④ What cell metabolism and structure should be complex would not be surprising, but actually, they are rather simple and logical. Even the most complex cell has only a small number of parts, each ⑤ responsible for a distinct, well-defined aspect of cell life.

According to its dictionary definition, an anthem is both a song of loyalty, often to a country, and a piece of ‘sacred music’, definitions that are both applicable in sporting contexts. This genre is dominated, although not exclusively, by football and has produced a number of examples ① where popular songs become synonymous with the club and are enthusiastically adopted by the fans. More than this they are often spontaneous expressions of loyalty and identity and, according to Desmond Morris, have ‘reached the level of something ② approached a local art form’. A strong element of the appeal of such sports songs ③ is that they feature ‘memorable and easily sung choruses in which fans can participate’. This is a vital part of the team’s performance ④ as it makes the fans’ presence more tangible. This form of popular culture can be said ⑤ to display pleasure and emotional excess in contrast to the dominant culture which tends to maintain ‘respectable aesthetic distance and control’.

Accepting whatever others are communicating only pays off if their interests correspond to ours—think cells in a body, bees in a beehive. As far as communication between humans is concerned, such commonality of interests ① is rarely achieved; even a pregnant mother has reasons to mistrust the chemical signals sent by her fetus. Fortunately, there are ways of making communication work even in the most adversarial of relationships. A prey can convince a predator not to chase ② it. But for such communication to occur, there must be strong guarantees ③ which those who receive the signal will be better off believing it. The messages have to be kept, on the whole, ④ honest. In the case of humans, honesty is maintained by a set of cognitive mechanisms that evaluate ⑤ communicated information. These mechanisms allow us to accept most beneficial messages—to be open—while rejecting most harmful messages—to be vigilant.

The idea that people ① selectively expose themselves to news content has been around for a long time, but it is even more important today with the fragmentation of audiences and the proliferation of choices. Selective exposure is a psychological concept that says people seek out information that conforms to their existing belief systems and ② avoid information that challenges those beliefs. In the past when there were few sources of news, people could either expose themselves to mainstream news—where they would likely see beliefs ③ expressed counter to their own—or they could avoid news altogether. Now with so many types of news constantly available to a full range of niche audiences, people can easily find a source of news ④ that consistently confirms their own personal set of beliefs. This leads to the possibility of creating many different small groups of people with each strongly ⑤ believes they are correct and everyone else is wrong about how the world works.

\*fragmentation: 분열

Most historians of science point to the need for a reliable calendar to regulate agricultural activity as the motivation for learning about what we now call astronomy, the study of stars and planets. Early astronomy provided information about when to plant crops and gave humans ① their first formal method of recording the passage of time. Stonehenge, the 4,000-year-old ring of stones in southern Britain, ② is perhaps the best-known monument to the discovery of regularity and predictability in the world we inhabit. The great markers of Stonehenge point to the spots on the horizon ③ where the sun rises at the solstices and equinoxes—the dates we still use to mark the beginnings of the seasons. The stones may even have ④ been used to predict eclipses. The existence of Stonehenge, built by people without writing, bears silent testimony both to the regularity of nature and to the ability of the human mind to see behind immediate appearances and ⑤ discovers deeper meanings in events.

The world's first complex writing form, Sumerian cuneiform, followed an evolutionary path, moving around 3500 BCE from pictographic to ideographic representations, from the depiction of objects to ① that of abstract notions. Sumerian cuneiform was a linear writing system, its symbols usually ② set in columns, read from top to bottom and from left to right. This regimentation was a form of abstraction: the world is not a linear place, and objects do not organize ③ themselves horizontally or vertically in real life. Early rock paintings, thought to have been created for ritual purposes, were possibly shaped and organized ④ to follow the walls of the cave, or the desires of the painters, who may have organized them symbolically, or artistically, or even randomly. Yet after cuneiform, virtually every form of script that has emerged has been set out in rows with a clear beginning and endpoint. So ⑤ uniformly is this expectation, indeed, that the odd exception is noteworthy, and generally established for a specific purpose.

The formats and frequencies of traditional trade encompass a spectrum. At the simplest level ① are the occasional trips made by individual !Kung and Dani to visit their individual trading partners in other bands or villages. ② Suggestive of our open-air markets and flea markets were the occasional markets at which Sio villagers living on the coast of northeast New Guinea met New Guineans from inland villages. Up to a few dozen people from each side ③ sat down in rows facing each other. An inlander pushed forward a net bag containing between 10 and 35 pounds of taro and sweet potatoes, and the Sio villager sitting opposite responded by offering a number of pots and coconuts ④ judging equivalent in value to the bag of food. Trobriand Island canoe traders conducted similar markets on the islands ⑤ that they visited, exchanging utilitarian goods (food, pots, and bowls) by barter, at the same time as they and their individual trade partners gave each other reciprocated gifts of luxury items (shell necklaces and armbands).

Regulations covering scientific experiments on human subjects are strict. Subjects must give their informed, written consent, and experimenters must submit their proposed experiments to thorough examination by overseeing bodies. Scientists who experiment on themselves can, functionally if not legally, avoid the restrictions ① associated with experimenting on other people. They can also sidestep most of the ethical issues involved: nobody, presumably, is more aware of an experiment's potential hazards than the scientist who devised ② it. Nonetheless, experimenting on oneself remains ③ deeply problematic. One obvious drawback is the danger involved; knowing that it exists ④ does nothing to reduce it. A less obvious drawback is the limited range of data that the experiment can generate. Human anatomy and physiology vary, in small but significant ways, according to gender, age, lifestyle, and other factors. Experimental results derived from a single subject are, therefore, of limited value; there is no way to know ⑤ what the subject's responses are typical or atypical of the response of humans as a group.

[2020년 7월 학평]

Metacognition simply means “thinking about thinking,” and it is one of the main distinctions between the human brain and that of other species. Our ability to stand high on a ladder above our normal thinking processes and ① evaluate why we are thinking as we are thinking is an evolutionary marvel. We have this ability ② because the most recently developed part of the human brain—the prefrontal cortex—enables self-reflective, abstract thought. We can think about ourselves as if we are not part of ③ ourselves. Research on primate behavior indicates that even our closest cousins, the chimpanzees, ④ lacking this ability (although they possess some self-reflective abilities, like being able to identify themselves in a mirror instead of thinking the reflection is another chimp). The ability is a double-edged sword, because while it allows us to evaluate why we are thinking ⑤ what we are thinking, it also puts us in touch with difficult existential questions that can easily become obsessions.

## 44. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2021학년도 6월 모평]

People from more individualistic cultural contexts tend to be motivated to maintain self-focused agency or control ① as these serve as the basis of one’s self-worth. With this form of agency comes the belief that individual successes ② depending primarily on one’s own abilities and actions, and thus, whether by influencing the environment or trying to accept one’s circumstances, the use of control ultimately centers on the individual. The independent self may be more ③ driven to cope by appealing to a sense of agency or control. However, people from more interdependent cultural contexts tend to be less focused on issues of individual success and agency and more motivated towards group goals and harmony. Research has shown ④ that East Asians prefer to receive, but not seek, more social support rather than seek personal control in certain cases. Therefore, people ⑤ who hold a more interdependent self-construal may prefer to cope in a way that promotes harmony in relationships.

\*self-construal: 자기 구성

## 45. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2020년 3월 학평]

When children are young, much of the work is demonstrating to them that they ① do have control. One wise friend of ours who was a parent educator for twenty years ② advises giving calendars to preschool-age children and writing down all the important events in their life, in part because it helps children understand the passage of time better, and how their days will unfold. We can't overstate the importance of the calendar tool in helping kids feel in control of their day. Have them ③ cross off days of the week as you come to them. Spend time going over the schedule for the day, giving them choice in that schedule wherever ④ possible. This communication expresses respect—they see that they are not just a tagalong to your day and your plans, and they understand what is going to happen, when, and why. As they get older, children will then start to write in important things for themselves, ⑤ it further helps them develop their sense of control.

[2020학년도 수능]

Speculations about the meaning and purpose of prehistoric art ① rely heavily on analogies drawn with modern-day hunter-gatherer societies. Such primitive societies, ② as Steven Mithen emphasizes in *The Prehistory of the Modern Mind*, tend to view man and beast, animal and plant, organic and inorganic spheres, as participants in an integrated, animated totality. The dual expressions of this tendency are anthropomorphism (the practice of regarding animals as humans) and totemism (the practice of regarding humans as animals), both of ③ which spread through the visual art and the mythology of primitive cultures. Thus the natural world is conceptualized in terms of human social relations. When considered in this light, the visual preoccupation of early humans with the nonhuman creatures ④ inhabited their world becomes profoundly meaningful. Among hunter-gatherers, animals are not only good to eat, they are also good to think about, as Claude Lévi-Strauss has observed. In the practice of totemism, he has suggested, an unlettered humanity “broods upon ⑤ itself and its place in nature.”

## 47. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2019년 10월 학평]

The modern adult human brain weighs only 1/50 of the total body weight but uses up to 1/5 of the total energy needs. The brain's running costs are about eight to ten times as high, per unit mass, as ① those of the body's muscles. And around 3/4 of that energy is expended on neurons, the ② specialized brain cells that communicate in vast networks to generate our thoughts and behaviours. An individual neuron ③ sends a signal in the brain uses as much energy as a leg muscle cell running a marathon. Of course, we use more energy overall when we are running, but we are not always on the move, whereas our brains never switch off. Even though the brain is metabolically greedy, it still outclasses any desktop computer both in terms of the calculations it can perform and the efficiency ④ at which it does this. We may have built computers that can beat our top Grand Master chess players, but we are still far away from designing one that is capable of recognizing and picking up one of the chess pieces as ⑤ easily as a typical three-year-old child can.

[2020학년도 6월 모평]

An interesting aspect of human psychology is that we tend to like things more and find them more ① appealing if everything about those things is not obvious the first time we experience them. This is certainly true in music. For example, we might hear a song on the radio for the first time that catches our interest and ② decide we like it. Then the next time we hear it, we hear a lyric we didn’t catch the first time, or we might notice ③ what the piano or drums are doing in the background. A special harmony ④ emerges that we missed before. We hear more and more and understand more and more with each listening. Sometimes, the longer ⑤ that takes for a work of art to reveal all of its subtleties to us, the more fond of that thing — whether it’s music, art, dance, or architecture — we become.

\*subtleties: 중요한 세부 요소[사항]들

## 51. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은? [3점]

[2019년 4월 학평]

The present moment feels special. It is real. However much you may remember the past or anticipate the future, you live in the present. Of course, the moment ① during which you read that sentence is no longer happening. This one is. In other words, it feels as though time flows, in the sense that the present is constantly updating ② itself. We have a deep intuition that the future is open until it becomes present and ③ that the past is fixed. As time flows, this structure of fixed past, immediate present and open future gets carried forward in time. Yet as ④ naturally as this way of thinking is, you will not find it reflected in science. The equations of physics do not tell us which events are occurring right now—they are like a map without the “you are here” symbol. The present moment does not exist in them, and therefore neither ⑤ does the flow of time.

## 52. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2019년 3월 학평 28번]

Baylor University researchers investigated ① whether different types of writing could ease people into sleep. To find out, they had 57 young adults spend five minutes before bed ② writing either a to-do list for the days ahead or a list of tasks they’d finished over the past few days. The results confirm that not all pre-sleep writing is created equally. Those who made to-do lists before bed ③ were able to fall asleep nine minutes faster than those who wrote about past events. The quality of the lists mattered, too; the more tasks and the more ④ specific the to-do lists were, the faster the writers fell asleep. The study authors figure that writing down future tasks ⑤ unloading the thoughts so you can stop turning them over in your mind. You’re telling your brain that the task will get done—just not right now.

## 53. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은? [3점]

People seeking legal advice should be assured, when discussing their rights or obligations with a lawyer, ① which the latter will not disclose to third parties the information provided. Only if this duty of confidentiality is respected ② will people feel free to consult lawyers and provide the information required for the lawyer to prepare the client's defense. Regardless of the type of information ③ disclosed, clients must be certain that it will not be used against them in a court of law, by the authorities or by any other party. It is generally considered to be a condition of the good functioning of the legal system and, thus, in the general interest. Legal professional privilege is ④ much more than an ordinary rule of evidence, limited in its application to the facts of a particular case. It is a fundamental condition on which the administration of justice as a whole ⑤ rests.

\*confidentiality: 비밀 유지

## 61. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

[2018학년도 9월 모평 28번]

The lack of real, direct experience in and with nature has caused many children to regard the natural world as mere abstraction, that fantastic, beautifully filmed place ① filled with endangered rainforests and polar bears in peril. This overstated, often fictionalized version of nature is no more real — and yet no less real — to them than the everyday nature right outside their doors, ② waits to be discovered in a child's way, at a child's pace. Consider the University of Cambridge study which found that a group of eight-year-old children was able to identify ③ substantially more characters from animations than common wildlife species. One wonders whether our children's inherent capacity to recognize, classify, and order information about their environment — abilities once essential to our very survival — is slowly devolving to facilitate life in ④ their increasingly virtualized world. It's all part of ⑤ what Robert Pyle first called "the extinction of experience."

The most dramatic and significant contacts between civilizations were ① when people from one civilization conquered and eliminated the people of another. These contacts normally were not only violent but brief, and ② they occurred only occasionally. Beginning in the seventh century A.D., relatively ③ sustained and at times intense intercivilizational contacts did develop between Islam and the West and Islam and India. Most commercial, cultural, and military interactions, however, were within civilizations. While India and China, for instance, were on occasion invaded and subjected by other peoples (Moguls, Mongols), both civilizations ④ having extensive times of "warring states" within their own civilization as well. Similarly, the Greeks fought each other and traded with each other far more often than they ⑤ did with Persians or other non-Greeks.

Though most bees fill their days visiting flowers and collecting pollen, some bees take advantage of the hard work of others. These thieving bees sneak into the nest of an ① unsuspecting "normal" bee (known as the host), lay an egg near the pollen mass being gathered by the host bee for her own offspring, and then sneak back out. When the egg of the thief hatches, it kills the host's offspring and then eats the pollen meant for ② its victim. Sometimes called brood parasites, these bees are also referred to as cuckoo bees, because they are similar to cuckoo birds, which lay an egg in the nest of another bird and ③ leaves it for that bird to raise. They are more ④ technically called cleptoparasites. Clepto means "thief" in Greek, and the term cleptoparasite refers specifically to an organism ⑤ that lives off another by stealing its food. In this case the cleptoparasite feeds on the host's hard-earned pollen stores.

In early modern Europe, transport by water was usually much cheaper than transport by land. An Italian printer calculated in 1550 ① that to send a load of books from Rome to Lyons would cost 18 scudi by land compared with 4 by sea. Letters were normally carried overland, but a system of transporting letters and newspapers, as well as people, by canal boat ② developed in the Dutch Republic in the seventeenth century. The average speed of the boats was a little over four miles an hour, ③ slow compared to a rider on horseback. On the other hand, the service was regular, frequent and cheap, and allowed communication not only between Amsterdam and the smaller towns, but also between one small town and another, thus ④ equalizing accessibility to information. It was only in 1837, with the invention of the electric telegraph, that the traditional link between transport and the communication of messages ⑤ were broken.

One of the simplest and most effective ways to build empathy in children ① is to let them play more on their own. Unsupervised kids are not reluctant to tell one another how they feel. In addition, children at play often take on other roles, pretending to be Principal Walsh or Josh's mom, happily forcing ② themselves to imagine how someone else thinks and feels. Unfortunately, free play is becoming rare. Boston College research professor Peter Gray has documented a continuous and ③ ultimately dramatic decline in children's opportunities to play and explore in their own chosen ways over the past fifty years in the United States and other developed countries. The effects have been especially ④ damaged, he argues, to empathy. He concludes that a decline of empathy and a rise in narcissism are exactly ⑤ what we would expect to see in children who have little opportunity to play socially.

When people face real adversity — disease, unemployment, or the disabilities of age — affection from a pet takes on new meaning. A pet's continuing affection becomes crucially important for ① those enduring hardship because it reassures them that their core essence has not been damaged. Thus pets are important in the treatment of ② depressed or chronically ill patients. In addition, pets are ③ used to great advantage with the institutionalized aged. In such institutions it is difficult for the staff to retain optimism when all the patients are declining in health. Children who visit cannot help but remember ④ what their parents or grandparents once were and be depressed by their incapacities. Animals, however, have no expectations about mental capacity. They do not worship youth. They have no memories about what the aged once ⑤ was and greet them as if they were children. An old man holding a puppy can relive a childhood moment with complete accuracy. His joy and the animal's response are the same.

Humans usually experience sound as the result of vibrations in air or water. Although sound that humans can sense ① is usually carried through these media, vibrations can also travel through soil, including rocks. Thus, sound can travel through a variety of substances with different densities, and the physical characteristics of the medium through which the sound travels have a major influence on ② how the sound can be used. For instance, it requires more energy to make water vibrate than to vibrate air, and it requires a great deal of energy to make soil vibrate. Thus, the use of vibrations in communication ③ depending on the ability of the sender to make a substance vibrate. Because of this, large animals such as elephants are more likely than small animals ④ to use vibrations in the soil for communication. In addition, the speed ⑤ at which sound travels depends on the density of the medium which it is traveling through.

If an animal is innately programmed for some type of behaviour, then there ① are likely to be biological clues. It is no accident that fish have bodies which are streamlined and ② smooth, with fins and a powerful tail. Their bodies are structurally adapted for moving fast through the water. Similarly, if you found a dead bird or mosquito, you could guess by looking at ③ its wings that flying was its normal mode of transport. However, we must not be over-optimistic. Biological clues are not essential. The extent to which they are ④ finding varies from animal to animal and from activity to activity. For example, it is impossible to guess from their bodies that birds make nests, and, sometimes, animals behave in a way quite contrary to ⑤ what might be expected from their physical form: ghost spiders have tremendously long legs, yet they weave webs out of very short threads. To a human observer, their legs seem a great hindrance as they spin and move about the web.

We all want to believe that our brains sort through information in the most rational way ① possible. On the contrary, countless studies show that there are many weaknesses of human reasoning. Common weaknesses in reasoning ② exist across people of all ages and educational backgrounds. For example, confirmation bias is ubiquitous. People pay attention to information that supports their viewpoints, while ③ ignoring evidence to the contrary. Confirmation bias is not the same as being stubborn, and is not constrained to issues ④ about which people have strong opinions. Instead, it acts at a subconscious level to control the way we gather and filter information. Most of us are not aware of these types of flaws in our reasoning processes, but professionals who work to convince us of certain viewpoints ⑤ to study the research on human decision making to determine how to exploit our weaknesses to make us more susceptible to their messages.
